

In []:

```
>> a = raw_input()
5 4 3 2
>> lis = a.split()
>> print (lis)
['5', '4', '3', '2']
>> newlis = list(map(int, lis))
>> print (newlis)
[5, 4, 3, 2]
```

CREATING SETS

```
>> myset = {1, 2} # Directly assigning values to a set
>> myset = set() # Initializing a set
>> myset = set(['a', 'b']) # Creating a set from a list
>> myset
{'a', 'b'}
```

MODIFYING SETS

Using the add() function:

```
>> myset.add('c')
>> myset
{'a', 'c', 'b'}
>> myset.add('a') # As 'a' already exists in the set, nothing happens
>> myset.add((5, 4))
>> myset
{'a', 'c', 'b', (5, 4)}
```

Using the update() function:

```
>> myset.update([1, 2, 3, 4]) # update() only works for iterable objects
>> myset
{'a', 1, 'c', 'b', 4, 2, (5, 4), 3}
>> myset.update({1, 7, 8})
>> myset
{'a', 1, 'c', 'b', 4, 7, 8, 2, (5, 4), 3}
>> myset.update({1, 6}, [5, 13])
>> myset
{'a', 1, 'c', 'b', 4, 5, 6, 7, 8, 2, (5, 4), 13, 3}
```

REMOVING ITEMS

Both the discard() and remove() functions take a single value as an argument and remove that value from the set.

If that value is not present, discard() does nothing, but remove() will raise a KeyError exception.

```
>> myset.discard(10)
>> myset
{'a', 1, 'c', 'b', 4, 5, 7, 8, 2, 12, (5, 4), 13, 11, 3}
>> myset.remove(13)
>> myset
{'a', 1, 'c', 'b', 4, 5, 7, 8, 2, 12, (5, 4), 11, 3}
```

COMMON SET OPERATIONS Using union(), intersection() and difference() functions.

```
>> a = {2, 4, 5, 9}
>> b = {2, 4, 11, 12}
>> a.union(b) # Values which exist in a or b
{2, 4, 5, 9, 11, 12}
>> a.intersection(b) # Values which exist in a and b
{2, 4}
>> a.difference(b) # Values which exist in a but not in b
{9, 5}
```

The union() **and** intersection() functions are symmetric methods:

```
>> a.union(b) == b.union(a)
True
>> a.intersection(b) == b.intersection(a)
True
>> a.difference(b) == b.difference(a)
False
```

In []:

```
#sort dictionary by values
sorted(dictionary.items(), key = lambda kv:(kv[1], kv[0]))
```

In []:

```
To find count of repetition of consecutive element
from itertools import groupby
s = input()
for key,grp in groupby(s):
    length = len(list(grp))
    print(f"({key}, {length})")
```

Input:11223334

Output;

```
(1, 2)
(2, 2)
(3, 3)
(4, 1)
```

Regular Expression

In []:

```
import re
DATA = "Hey, you - what are you doing here!?"
print re.findall(r"[\w']+","", DATA)
# Prints ['Hey', 'you', 'what', 'are', 'you', 'doing', 'here']
```

In [24]:

```
import re  
s = '@something.co1'  
re.split('; |, |\\@|\\. ', s)
```

Out[24]:

```
['', 'something', 'co1']
```

In []:

group()
A group() expression returns one **or** more subgroups of the match.

Code

```
>>> import re
>>> m = re.match(r'(\w+)@(\w+)\.(\w+)', 'username@hackerrank.com')
>>> m.group(0)      # The entire match
'username@hackerrank.com'
>>> m.group(1)      # The first parenthesized subgroup.
'username'
>>> m.group(2)      # The second parenthesized subgroup.
'hackerrank'
>>> m.group(3)      # The third parenthesized subgroup.
'com'
>>> m.group(1,2,3)  # Multiple arguments give us a tuple.
('username', 'hackerrank', 'com')
```

groups()
A groups() expression returns a **tuple** containing **all** the subgroups of the match.
Code

```
>>> import re
>>> m = re.match(r'(\w+)@(\w+)\.(\w+)', 'username@hackerrank.com')
>>> m.groups()
('username', 'hackerrank', 'com')
```

groupdict()
A groupdict() expression returns a dictionary containing **all** the named subgroups of the match, keyed by the subgroup name.
Code

```
>>> m = re.match(r'(?P<user>\w+)@(?P<website>\w+)\. (?P<extension>\w+)', 'myname@hackerrank.com')
>>> m.groupdict()
{'website': 'hackerrank', 'user': 'myname', 'extension': 'com'}
```

re.findall()
The expression re.findall() returns **all** the non-overlapping matches of patterns **in** a string **as** a **list** of strings.
Code

```
>>> import re
>>> re.findall(r'\w', 'http://www.hackerrank.com/')
['h', 't', 't', 'p', 'w', 'w', 'w', 'h', 'a', 'c', 'k', 'e', 'r', 'r', 'a', 'n', 'k', 'c', 'o', 'm']
re.finditer()
The expression re.finditer() returns an iterator yielding MatchObject instances over all non-overlapping matches for the re pattern in the string.  
Code
```

```
>>> import re
>>> re.finditer(r'\w', 'http://www.hackerrank.com/')
<callable-iterator object at 0x0266C790>
>>> map(lambda x: x.group(), re.finditer(r'\w', 'http://www.hackerrank.com/'))
['h', 't', 't', 'p', 'w', 'w', 'w', 'h', 'a', 'c', 'k', 'e', 'r', 'r', 'a', 'n', 'k', 'c', 'o', 'm']
```

In []:

```
import re

2

In []:

The re.sub() tool (sub stands **for** substitution) evaluates a pattern **and**, **for** each valid match, it calls a method (**or lambda**).

The method **is** called **for all** matches **and** can be used to modify strings **in** different way s.

The re.sub() method returns the modified string **as** an output.

example:

```
import re
```

```
#Squaring numbers
```

```
def square(match):
```

```
    number = int(match.group(0))
```

```
    return str(number**2)
```

```
print re.sub(r"\d+", square, "1 2 3 4 5 6 7 8 9")
```

output:

```
1 4 9 16 25 36 49 64 81
```

```
import re
```

```
html = """
```

```
<head>
```

```
<title>HTML</title>
```

```
</head>
```

```
<object type="application/x-flash"
```

```
    data="your-file.swf"
```

```
    width="0" height="0">
```

```
    <!-- <param name="movie" value="your-file.swf" /> -->
```

```
    <param name="quality" value="high"/>
```

```
</object>
```

```
"""
```

```
print re.sub("<!--.*?-->", "", html) #remove comment
```

Output:

```
<head>
```

```
<title>HTML</title>
```

```
</head>
```

```
<object type="application/x-flash"
```

```
    data="your-file.swf"
```

```
    width="0" height="0">
```

```
    <param name="quality" value="high"/>
```

```
</object>
```

In [38]:

```
import re
```

```
N = int(input())
```

```
for i in range(N):
```

```
    print(re.sub(r'(?<= )(&&|\||\|)(?= )', lambda x: 'and' if x.group() == '&&' else 'o  
r',input()))
```

And

In [116]:

```

l1 = ['07895462130', '919875641230', '9195969878']
l2 = []
for x in l1:
    if len(x) == 10:
        l2.append('+91 ' + x[0:6] + ' ' + x[5:])

    elif re.findall('(?!<=91)(.*?)$',x):
        number = re.findall('(?!<=91)(.*?)$',x)[0]
        print(x,number)
        l2.append('+91 '+number[0:6] + ' ' + number[5:])

    elif re.findall('(?!<=\+91)(.*?)$',x):
        number = re.findall('(?!<=\+91)(.*?)$',x)
        print(x,number)
        l2.append('+91 '+number[0:6] + ' ' + number[5:])

    elif re.findall('(?!<=0)(.*?)$',x):
        number = re.findall('(?!<=0)(.*?)$',x)[0]

```

NUMPY

In []:

The NumPy (Numeric Python) package helps us manipulate large arrays and matrices of numeric data.

To use the NumPy module, we need to import it using:

```

import numpy
Arrays

```

A NumPy array is a grid of values. They are similar to lists, except that every element of an array must be the same type.

```

import numpy

a = numpy.array([1,2,3,4,5])
print a[1]          #2

b = numpy.array([1,2,3,4,5],float)
print b[1]          #2.0

```

In [122]:

```
l1 = [1,2,3]  
print(l1[::-1])
```

[3, 2, 1]

In []:

shape:

The shape tool gives a **tuple** of array dimensions **and** can be used to change the dimensions of an array.

(a). Using shape to get array dimensions

```
import numpy
```

```
my_1D_array = numpy.array([1, 2, 3, 4, 5])
```

```
print my_1D_array.shape      #(5,) -> 5 rows and 0 columns
```

```
my_2D_array = numpy.array([[1, 2],[3, 4],[6,5]])
```

```
print my_2D_array.shape      #(3, 2) -> 3 rows and 2 columns
```

(b). Using shape to change array dimensions

```
import numpy
```

```
change_array = numpy.array([1,2,3,4,5,6])
```

```
change_array.shape = (3, 2)
```

```
print change_array
```

```
#Output
```

```
[[1 2]
```

```
[3 4]
```

```
[5 6]]
```

reshape:

The reshape tool gives a new shape to an array without changing its data. It creates a new array **and** does **not** modify the original array itself.

```
import numpy
```

```
my_array = numpy.array([1,2,3,4,5,6])
```

```
print numpy.reshape(my_array,(3,2))
```

```
#Output
```

```
[[1 2]
```

```
[3 4]
```

```
[5 6]]
```

Transpose:

We can generate the transposition of an array using the tool `numpy.transpose`. It will **not** affect the original array, but it will create a new array.

```
import numpy
```

```
my_array = numpy.array([[1,2,3],
                        [4,5,6]])
```

```
print numpy.transpose(my_array)
```

```
#Output
```

```
[[1 4]
```

```
[2 5]
```

```
[3 6]]
```

Flatten:

The tool `flatten` creates a copy of the **input** array flattened to one dimension.

```
import numpy
```

```
my_array = numpy.array([[1,2,3],
                        [4,5,6]])
```

```
print my_array.flatten()
```

```
#Output
```

```
[1 2 3 4 5 6]
```

Concatenate

Two **or** more arrays can be concatenated together using the `concatenate` function **with** a **tuple** of the arrays to be joined:

```
import numpy
array_1 = numpy.array([1,2,3])
array_2 = numpy.array([4,5,6])
array_3 = numpy.array([7,8,9])
print numpy.concatenate((array_1, array_2, array_3))
#Output
```

```
[1 2 3 4 5 6 7 8 9]
```

If an array has more than one dimension, it **is** possible to specify the axis along which multiple arrays are concatenated. By default, it **is** along the first dimension.

```
import numpy
array_1 = numpy.array([[1,2,3],[0,0,0]])
array_2 = numpy.array([[0,0,0],[7,8,9]])
print numpy.concatenate((array_1, array_2), axis = 1)
#Output
[[1 2 3 0 0 0]
 [0 0 0 7 8 9]]
```

zeros

The zeros tool returns a new array **with** a given shape **and** type filled **with** 's.

```
import numpy
print numpy.zeros((1,2))           #Default type is float
#Output : [[ 0.  0.]]
print numpy.zeros((1,2), dtype = numpy.int) #Type changes to int
#Output : [[0 0]]
```

ones

The ones tool returns a new array **with** a given shape **and** type filled **with** 's.

```
import numpy
print numpy.ones((1,2))           #Default type is float
#Output : [[ 1.  1.]]
print numpy.ones((1,2), dtype = numpy.int) #Type changes to int
#Output : [[1 1]]
```

identity

The identity tool returns an identity array. An identity array **is** a square matrix **with** all the main diagonal elements **as** **and** the rest **as** . The default **type** of elements **is** float.

```
import numpy
print numpy.identity(3) #3 is for dimension 3 X 3
#Output
[[ 1.  0.  0.]
 [ 0.  1.  0.]
 [ 0.  0.  1.]]
```

eye

The eye tool returns a 2-D array **with** 's as the diagonal and 's elsewhere. The diagonal can be main, upper **or** lower depending on the optional parameter . A positive **is** for the upper diagonal, a negative **is** for the lower, **and** a (default) **is** for the main diagonal.

```
import numpy
print numpy.eye(8, 7, k = 1)      # 8 X 7 Dimensional array with first upper diagonal 1.
#Output
[[ 0.  1.  0.  0.  0.  0.  0.]
 [ 0.  0.  1.  0.  0.  0.  0.]
 [ 0.  0.  0.  1.  0.  0.  0.]
 [ 0.  0.  0.  0.  1.  0.  0.]
 [ 0.  0.  0.  0.  0.  1.  0.]
 [ 0.  0.  0.  0.  0.  0.  1.]
 [ 0.  0.  0.  0.  0.  0.  0.]
```

```
[ 0.  0.  0.  0.  0.  0.  0.]  
print numpy.eye(8, 7, k = -2)    # 8 X 7 Dimensional array with second lower diagonal 1.
```

In [8]:

```
import numpy  
array_1 = numpy.array([[1,2,3],[1,0,0]])  
array_2 = numpy.array([[0,0,0],[7,8,9]])  
print(numpy.concatenate((array_1, array_2), axis = 0))
```

```
[[1 2 3]  
 [1 0 0]  
 [0 0 0]  
 [7 8 9]]
```

In [14]:

```
import numpy  
#numpy.identity(4)  
numpy.eye(4,3,k=0)
```

Out[14]:

```
array([[1., 0., 0.],  
       [0., 1., 0.],  
       [0., 0., 1.],  
       [0., 0., 0.]])
```

In []:
